

# “FOOD DELEVERY WEBSITE & APPLICATION”

---

## Task - 1

# “FOOD DELEVERY WEBSITE & APPLICATION”

## Your Project Introduction

The Online Food Ordering System allows the restaurant employees to easily manage the site content, most importantly the menu, themselves through a very intuitive graphical interface. Visitors to the site, once registered, are then able to easily navigate this menu, add food items to their order, and specify delivery options with only a few clicks, greatly simplifying the ordering process. Back in the restaurant, placed orders are promptly retrieved and displayed in an easily readable format for processing.

LMS Username	Name	Batch

## Task -1

### Creation of SRS & Github

- Create SRS : “**FOOD DELEVERY WEBSITE & APPLICATION**”
- Creation & Set-up of Github account
- Creation & Hands-on to various commands of Git Bash

### Evaluation Metric:

- 100% Completion of the above tasks

### Learning Outcome

- Get to know about different lifecycle models.
- Understanding importance and how to create an SRS
- Knowing various commands of Github
- Understanding agile and scrum management techniques for efficient product development

## Step-Wise Description

### Step 1:

A consumer will get recommendations of nearby restaurants or some special orders for the day. Right from restaurant selection to checkout and payment, the consumer is at the lead. The users know how to create a basket of the desired items in the food ordering app.

### Step 2:

Once the items are in the cart, the user can review them and move to payment.

### Step 3:

Once the order is final, the restaurant gets a notification and starts preparing the food. In your journey to make a food delivery app, it is also essential to know how to connect the user with the restaurant and the delivery guy.

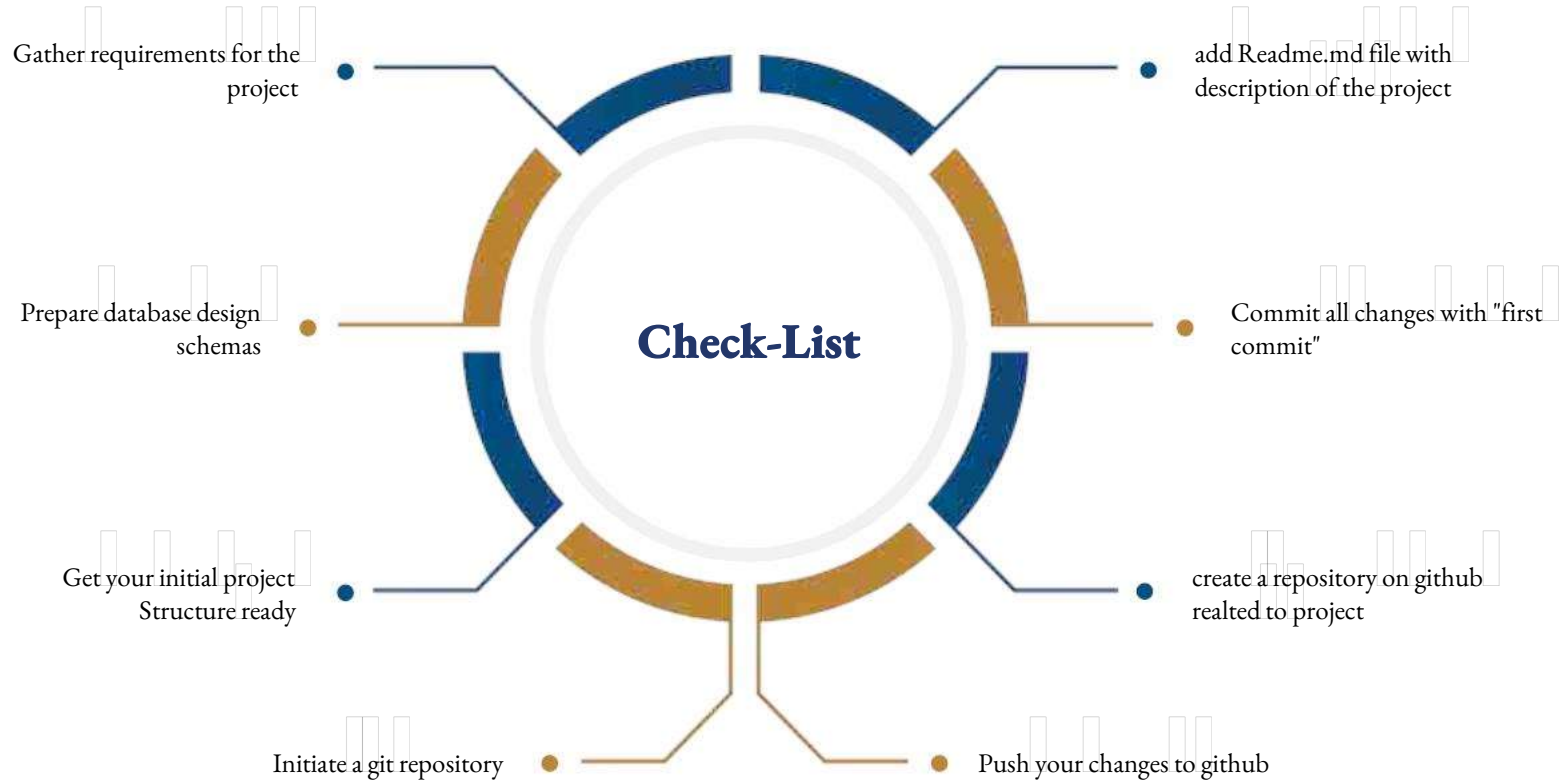

### Step 4:

After preparation, a delivery guy takes the order and delivers it to the customer on their specified address.

## Summary of your task

The process consists of a customer choosing the restaurant of their choice, scanning the menu items, choosing an item, and finally choosing for pick-up or delivery. Payment is then administered by paying with a credit card or debit card through the app or website or in cash at the restaurant when going to pickup.

# Assessment Parameter

# **1.Introduction**

## **1.1 Purpose**

Food delivery apps are third-party delivery services hosted on mobile applications that restaurants or retailers partner with to showcase their menu and food offerings, allowing customers to order food and get it delivered to their doorstep.

## **Document Conventions**

Entire document should be justified. Convention for Main title

Font face: Times New Roman

Font style: Bold

Font Size: 14

Convention for Sub title

Font face: Times New Roman

Font style: Bold

Font Size: 12

Convention for body Font face: Times New Roman

Font Size:12

## 1.3 Scope of Development Project

Food Ordering app can sale Food product, preferred brands, kitchen needs, essential restaurant supplies and more, through this online, one stop Food store. It provides you with a convenient way to sale from your Food shopping app. You can use this app as one big super market app to sale product of your store. This app make easy for user to buy product from store with easy steps and store can get easy order.

## Definitions, Acronyms and Abbreviations

JAVA -> platform independence

SQL-> Structured query Language

ER-> Entity Relationship

UML -> Unified Modeling Language

IDE-> Integrated Development Environment

SRS-> Software Requirement Specification

ISBN -> International Standard Book Number

IEEE ->Institute of Electrical and Electronics Engineers

## 2.Overall Descriptions

Use case diagram for online food delivery system

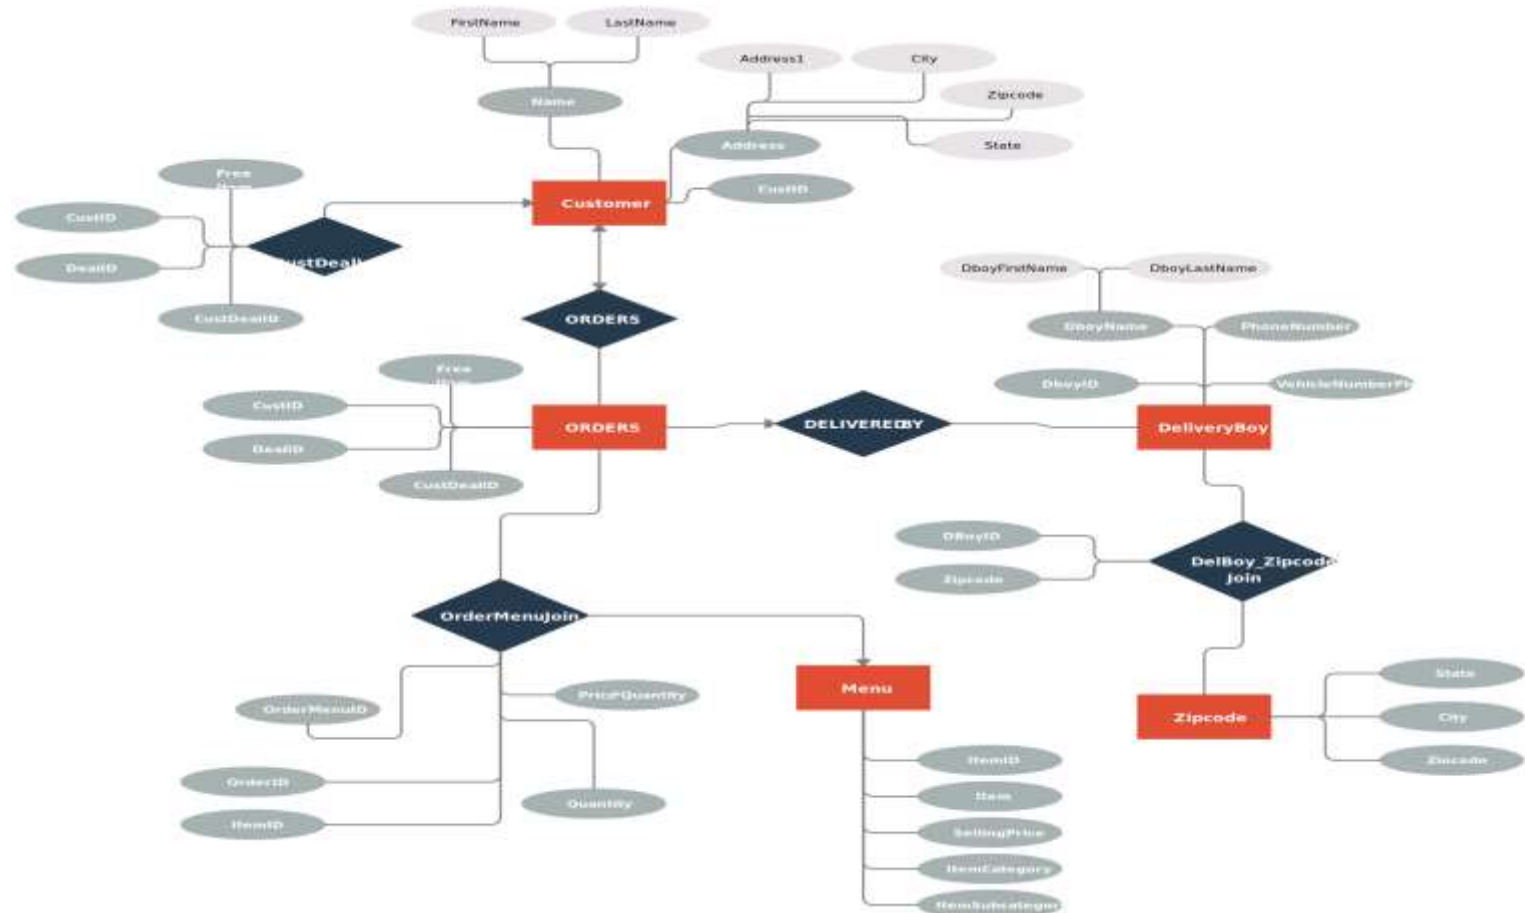

## Class diagram

## Product Function

Entity Relationship Diagram of online food delivery system.

### **3. Functional Requirements**

#### **3.1 User Registration and Authentication**

Users can register and log in using email or social media accounts.

User roles include customers and restaurant owners.

Authentication and authorization mechanisms will be implemented.

#### **3.2 Restaurant Listings**

Users can search for restaurants by location, cuisine, or restaurant name.

Restaurant details include name, location, cuisine, ratings, and reviews.

### **3.3 Menu Management (Restaurant Owners)**

Restaurant owners can log in and manage their menus.  
Add, edit, or remove items from the menu.  
Set item prices and descriptions.

### **3.4 Ordering Process**

Customers can browse restaurant menus.  
Add items to the shopping cart.  
Review and modify the cart.  
Place orders, providing delivery details and payment information.

### **3.5 Order Tracking**

Users can track the status of their orders (e.g., order received, preparing, out for delivery).  
Receive notifications when the order status changes.

### **3.6 Payment Processing**

Securely process payments using a third-party payment gateway.

### **3.7 User Reviews and Ratings**

Users can leave reviews and ratings for restaurants.

Reviews should include text comments and star ratings.

## **4. Non-Functional Requirements**

### **4.1 Performance**

The website should load quickly and handle a large number of concurrent users.

Response times for critical functions should be below predefined thresholds.

### **4.2 Security**

Implement encryption for user data and transactions.

Protect against common web application security threats (e.g., SQL injection, cross-site scripting).

### **4.3 Usability**

The user interface should be intuitive and easy to navigate.

Ensure accessibility compliance.

### **4.4 Scalability**

The system should be designed to scale horizontally to accommodate increased user load.

### **4.5 Reliability**

The system should be highly available and minimize downtime.

## **5. Technical Requirements**

### **5.1 Backend**

Develop the backend using Java.

Use a relational database (e.g., MySQL) for data storage.

Implement RESTful APIs for communication between the frontend and backend.

### **5.2 Frontend**

Develop the frontend using HTML, CSS, JavaScript, and React.js.

Ensure cross-browser compatibility.

Implement responsive design for mobile devices.

## **6. Conclusion**

This Software Requirement Specification (SRS) serves as a foundational document for your food delivery website project. It should be continually updated and refined as the project progresses and requirements evolve.
